

## BLUEPRINT

# Intrusion Prevention

## Stop attacks before they cause damage.

Detection matters, but the cheapest incident is the one that never happens. Intrusion prevention actively blocks known attacks, exploitation attempts and malicious traffic – at the network edge, inside the network and on endpoints.

### What we deploy and configure

- intrusion prevention systems (IPS) and next-generation firewalls
- network segmentation to limit how far an attack can spread
- endpoint and server protection (EDR)
- secure remote access
- hardening of key systems

### How we work

- 1 We assess where your biggest risks come from.
- 2 We design layered protection that fits your environment.
- 3 We roll it out step by step, starting in monitoring mode so business is not disrupted.
- 4 We keep tuning and updating the rules.

### What you get

- automatic blocking of known attacks and malicious traffic
- less room for an attacker, even if they get in
- protection tuned so it doesn't slow down everyday work

**AI**

**AI in practice** Modern protection tools use AI to recognise new, previously unknown attacks.

**Who it's for** organisations that want to actively stop attacks, not just record them.

**Let's talk about strengthening your defences.**
