

BLUEPRINT

Security Monitoring

See what's happening – and keep a record of it.

Without event records, an attack can be neither detected in time nor investigated afterwards. Security monitoring collects security-relevant events from all important systems in one place, stores them securely and alerts on suspicious activity.

What it covers

- event collection from servers, network devices, security tools, applications and cloud services
- central, secure log storage with defined retention
- alerts on suspicious events
- clear reports for IT and management
- meeting regulatory logging requirements

What you get

- one place to see security activity across the whole organisation
- faster detection of problems
- reliable evidence for incident investigations
- compliance with logging and oversight obligations

AI

AI in practice Language models summarise and triage events, so analysts can focus on what matters.

Who it's for organisations that want visibility into their systems – and need to be able to prove they have it.

Let us help you gain visibility.
