

SOLUTION OVERVIEW

SIEM

Out of thousands of events, we surface the ones that matter.

A SIEM (Security Information and Event Management) system brings monitoring data together, correlates it and analyses it automatically. Individual events that look harmless on their own are pieced together into a picture of an attack in progress, so you can respond quickly.

What we do for you

- design and deploy a SIEM sized to your environment and needs
- connect data sources and normalise their formats
- build detection use cases around your specific risks
- tune the rules so alerts are relevant and free of unnecessary noise
- automate repetitive analysis and response steps
- prepare dashboards and reports, including regulatory reporting

What you get

- faster detection of real threats
- fewer false alarms and less manual work
- a single view of security across the organisation
- a solution that evolves as threats do

AI

AI in practice: An AI assistant speeds up alert analysis and suggests next steps; the analyst decides.

Who it's for: organisations with large or diverse IT environments where reviewing logs by hand is no longer enough.

Let's discuss a SIEM for your environment
