

## BLUEPRINT

# Vulnerability Detection

## Find the weak spots before attackers do.

Thousands of new vulnerabilities are published every month, and attackers often start exploiting them within days – sometimes hours – of disclosure. Regularly finding weaknesses and fixing them quickly is one of the most effective ways to reduce risk.

### What we do

- regular scanning of servers, network devices, applications and cloud services
- configuration checks against established security best practices
- prioritisation by real risk – whether a vulnerability is actively exploited, exposed to the internet and how critical the affected system is
- tracking every fix through to verification

### What you get

- an up-to-date view of weaknesses across your whole environment
- a clear order of what to fix first
- measurable progress over time
- evidence for audits and regulators

**AI**

**AI in practice** AI helps us quickly assess new vulnerabilities and identify which ones affect your systems.

**Who it's for** organisations that don't want a new vulnerability in their systems to go unnoticed.

**Find out how your systems are doing.**
